

Jackson Dawson – Project Part 1: Topic Selection

Name of Website: Jackson Dawson Academic and Personal Portfolio

Description: Hoping to create a usable portfolio website for academic and personal projects. Ideally, this would contain projects I've worked on throughout college and the projects I will work on in my early career. So far, that includes early academic projects such as the CSCE 190 website and the CSCE 240 application. Along with academic projects, I have a few personal projects I've been working on at home that I might include if I find them to be useful in employment. I think this would be a great opportunity to spend time and design a website that can help me in the future.

At the minimum, I hope to include pages as the following: Home Page (Introduction to the portfolio), About Me, Projects, Contact Me, and a Helpful Links page (Linkedin, Github, etc.).

In terms of storing data, I want to hold and manage all of the information for each individual project in a database. This information might include relevant skills related to each project, project descriptions, etc. I also want to include an ability to manipulate that data from the website itself, so maybe I could include a login function (stored in a database) so only I can access that. I also want the ability to add projects, and in that be able to easily insert those similar to adding data mentioned above.
